

How do solid-state batteries work?

Solid-state batteries work on the same basic idea as conventional lithium-ion batteries: ions flow between two electrodes, an anode and a cathode, to store and release energy. They differ, though, in that they employ a solid electrolyte rather than a liquid one.

How do solid-state batteries improve lithium-ion batteries?

Solid-state batteries improve lithium-ion batteries by using a solid electrolyte in place of a liquid or polymer electrolyte. It just so happens that this change improves nearly all the battery's characteristics. Solid-state batteries tick all the boxes of our fantasy battery tech.

What is a solid-state battery?

Solid-state batteries are one of the discoveries to come out of that process, using different electrolytes to achieve the same goal as any other type of battery, but faster, cheaper, and less prone to exploding. The electrolyte best poised to replace lithium-ion batteries is a sodium-based glass electrolyte.

What is a solid-state battery (SSB)?

A solid-state battery (SSB) is an electrical battery that uses a solid electrolyte (solectro) to conduct ions between the electrodes, instead of the liquid or gel polymer electrolytes found in conventional batteries. Solid-state batteries theoretically offer much higher energy density than the typical lithium-ion or lithium polymer batteries.

What is the difference between a lithium ion and a solid-state battery?

Conventional secondary batteries use a liquid as the electrolyte, but solid-state batteries use a solid as the electrolyte. It is expected that the solid electrolyte will enable larger-capacity and higher-output batteries than lithium-ion batteries. Moreover, making the electrolyte solid has advantages in terms of safety over lithium-ion batteries.

What is the internal structure of a solid-state battery?

However, the internal structure of a solid-state cell is very different, as all its parts are solid. While in traditional lithium batteries, the electrolyte is a liquid, solid-state cells are formed of: A cathode (or positive electrode), which can be made with the same compounds as a lithium-ion battery (eg. LFP, NMC, LMO, etc)
